Task 1: Integrate a map into the web app

Considerations: Need a map tool that is aesthetically pleasing, easily deployable, and allows for vending machine markers to be added from a csv.

Design: I chose the tool Leaflet. It is very robust and nice looking and no install is required, a link in the html loads the mapping library from Leaflet. I think it would look nice on the main page in the block with searching and filtering machines so it is immediately visible and filtering also filters/searches the map once implemented.

Test cases:

Test	Expected	Result
Map displays in the correct spot	Map shows inside the “search by building” block.	Passed
Map shows correct information	Map displays ETSU campus with correct information	Passed
Mobile Functionality	Map works on mobile version
